

Press Release

Realtime jobs with Windows and ADDI-DATA boards

In the automation field, applications must often be realised in real time. Yet for Windows users it is really a problem. But with corresponding realtime extensions like for example RTX, applications can also run on Windows base.

Addi-Data offers as of now RTX drivers from version 5.1.1 for using its safety PC boards with Windows NT, Windows 2000 and Windows XP. In a first step drivers are available for the following PCI and CPCI boards: multifunction counter board for incremental encoder/SSI, 16 bit analog multifunction board, 32/64 digital I/O boards and 4-port serial interface. The functions of the boards are stored in a RTSS library. The RTX drivers are available as source code to be individually adapted.

RTX drivers for further PCI boards of Addi-Data are deliverable on request.
